

Abstract of the Disclosure

Disclosed is a test cell and a method for detection of a preselected ligand in a liquid sample such as a body The test cell includes an elongate outer casing fluid. which houses an interior permeable material capable of transporting an aqueous solution and defining a sample inlet, a test volume, and a reservoir volume. reservoir volume is disposed in a section of the test cell spaced apart from the inlet and is filled with sorbent material. The reservoir acts to receive liquid transported along a flow path defined by the permeable material and Extending from the inlet and through the test volume. the test volume is a test site which includes a first protein having a binding site specific to a first epitope of the ligand immobilized in fluid communication with the The test site can be observed through a window of the casing.
